Theme 4: live guidance, in the moment

LISTEN → UNDERSTAND → ASSIST

Prelude turns a live support conversation into grounded, actionable guidance—without making the agent leave the call flow. It detects intent, retrieves trusted knowledge and proposes the next best response in real time.

Why standard approaches fall short

01

Static scripts

Break when the conversation changes.

02

Search portals

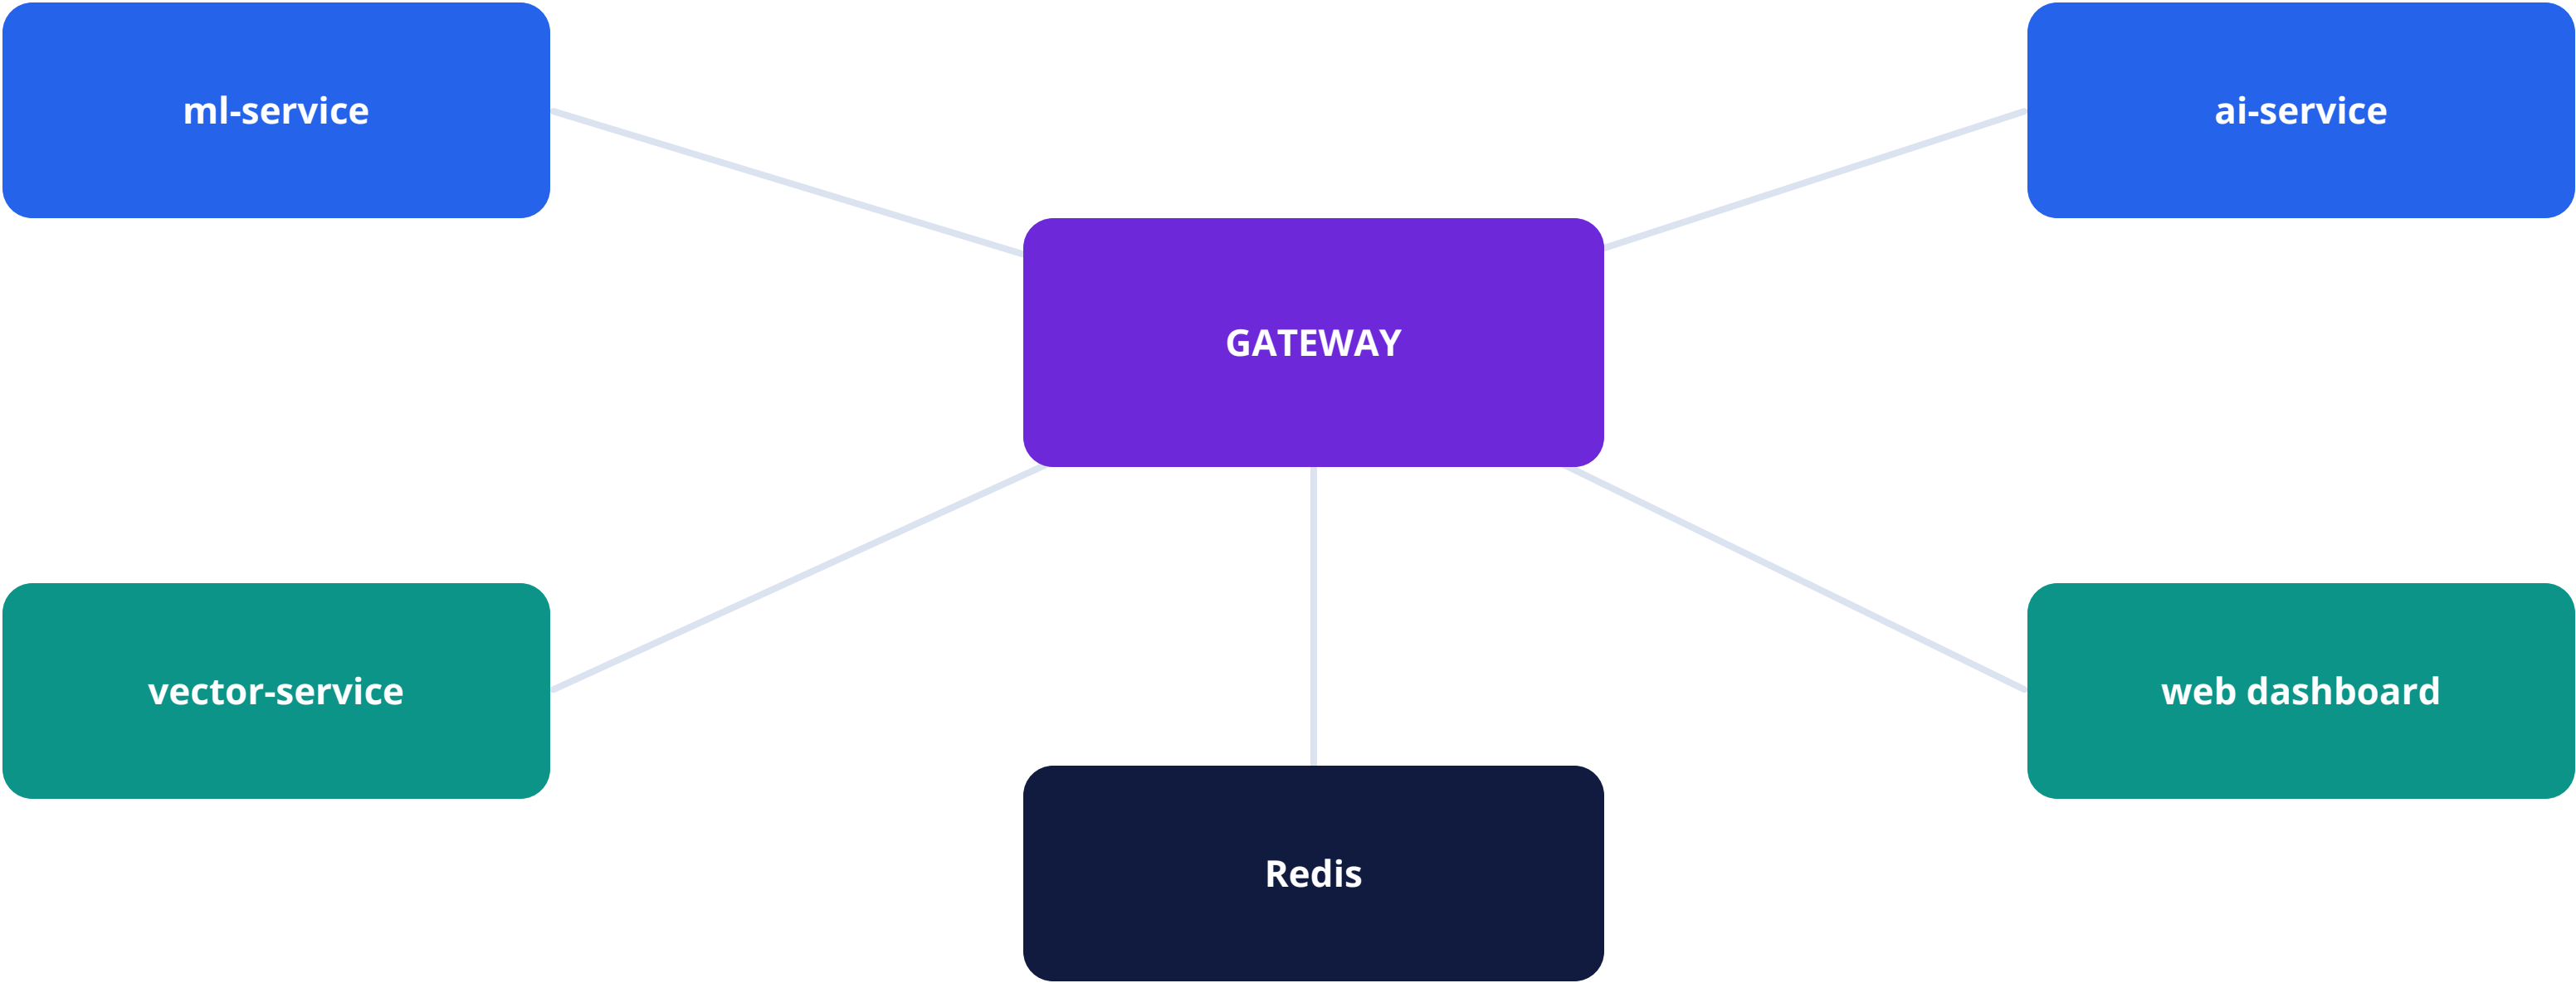

Force agents to pause, type and scan.

03

Generic copilots

Answer quickly—but without trusted grounding.

One gateway. Five focused services.

Streaming orchestration • grounded retrieval • modular deployment

From live voice to confident action

01 Capture

Streams the conversation as it happens.

02 Ground

Retrieves policy-safe, relevant context.

03 Assist

Surfaces the response and next action.

Built as a modular, production-minded stack

EXPERIENCE

Web dashboard • Real-time agent workspace

ORCHESTRATION

Gateway • APIs • Streaming events

INTELLIGENCE

LLM reasoning • Embeddings • Retrieval

DATA & STATE

Vector service • Redis • Session context

Better calls for agents and customers

For high-context voice support

Agents

Less searching, lower cognitive load and more consistent guidance.

Customers

Faster, clearer resolutions with context preserved throughout the call.

What is new, proven—and still open

Innovation

A service-based assist layer that combines live context, retrieval and response orchestration.

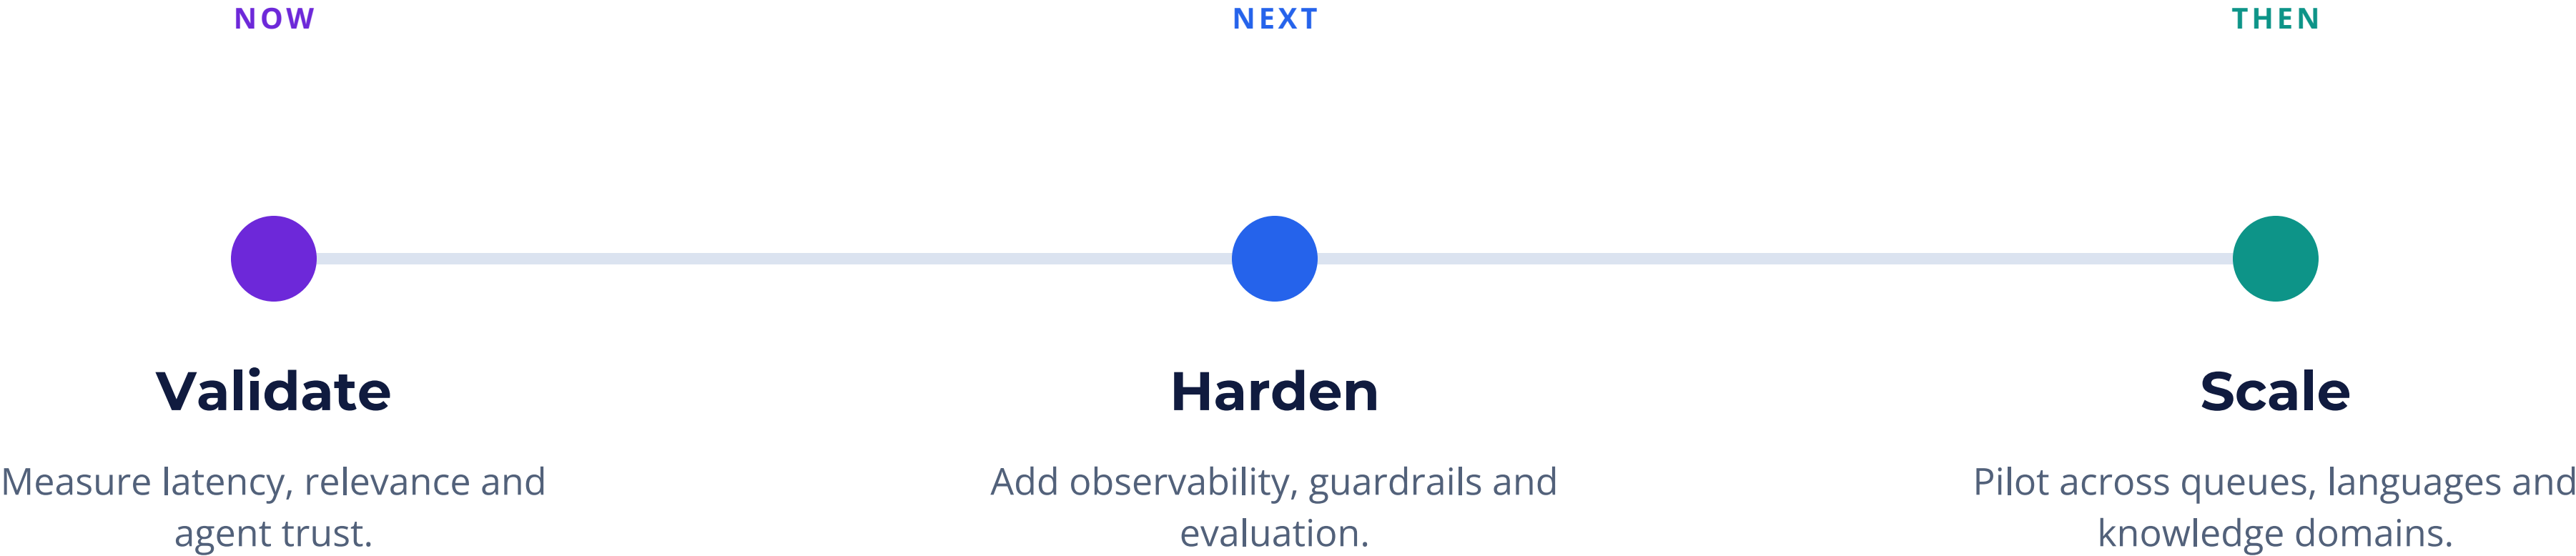

Results

An end-to-end prototype demonstrates the full voice-to-guidance loop and dashboard handoff.

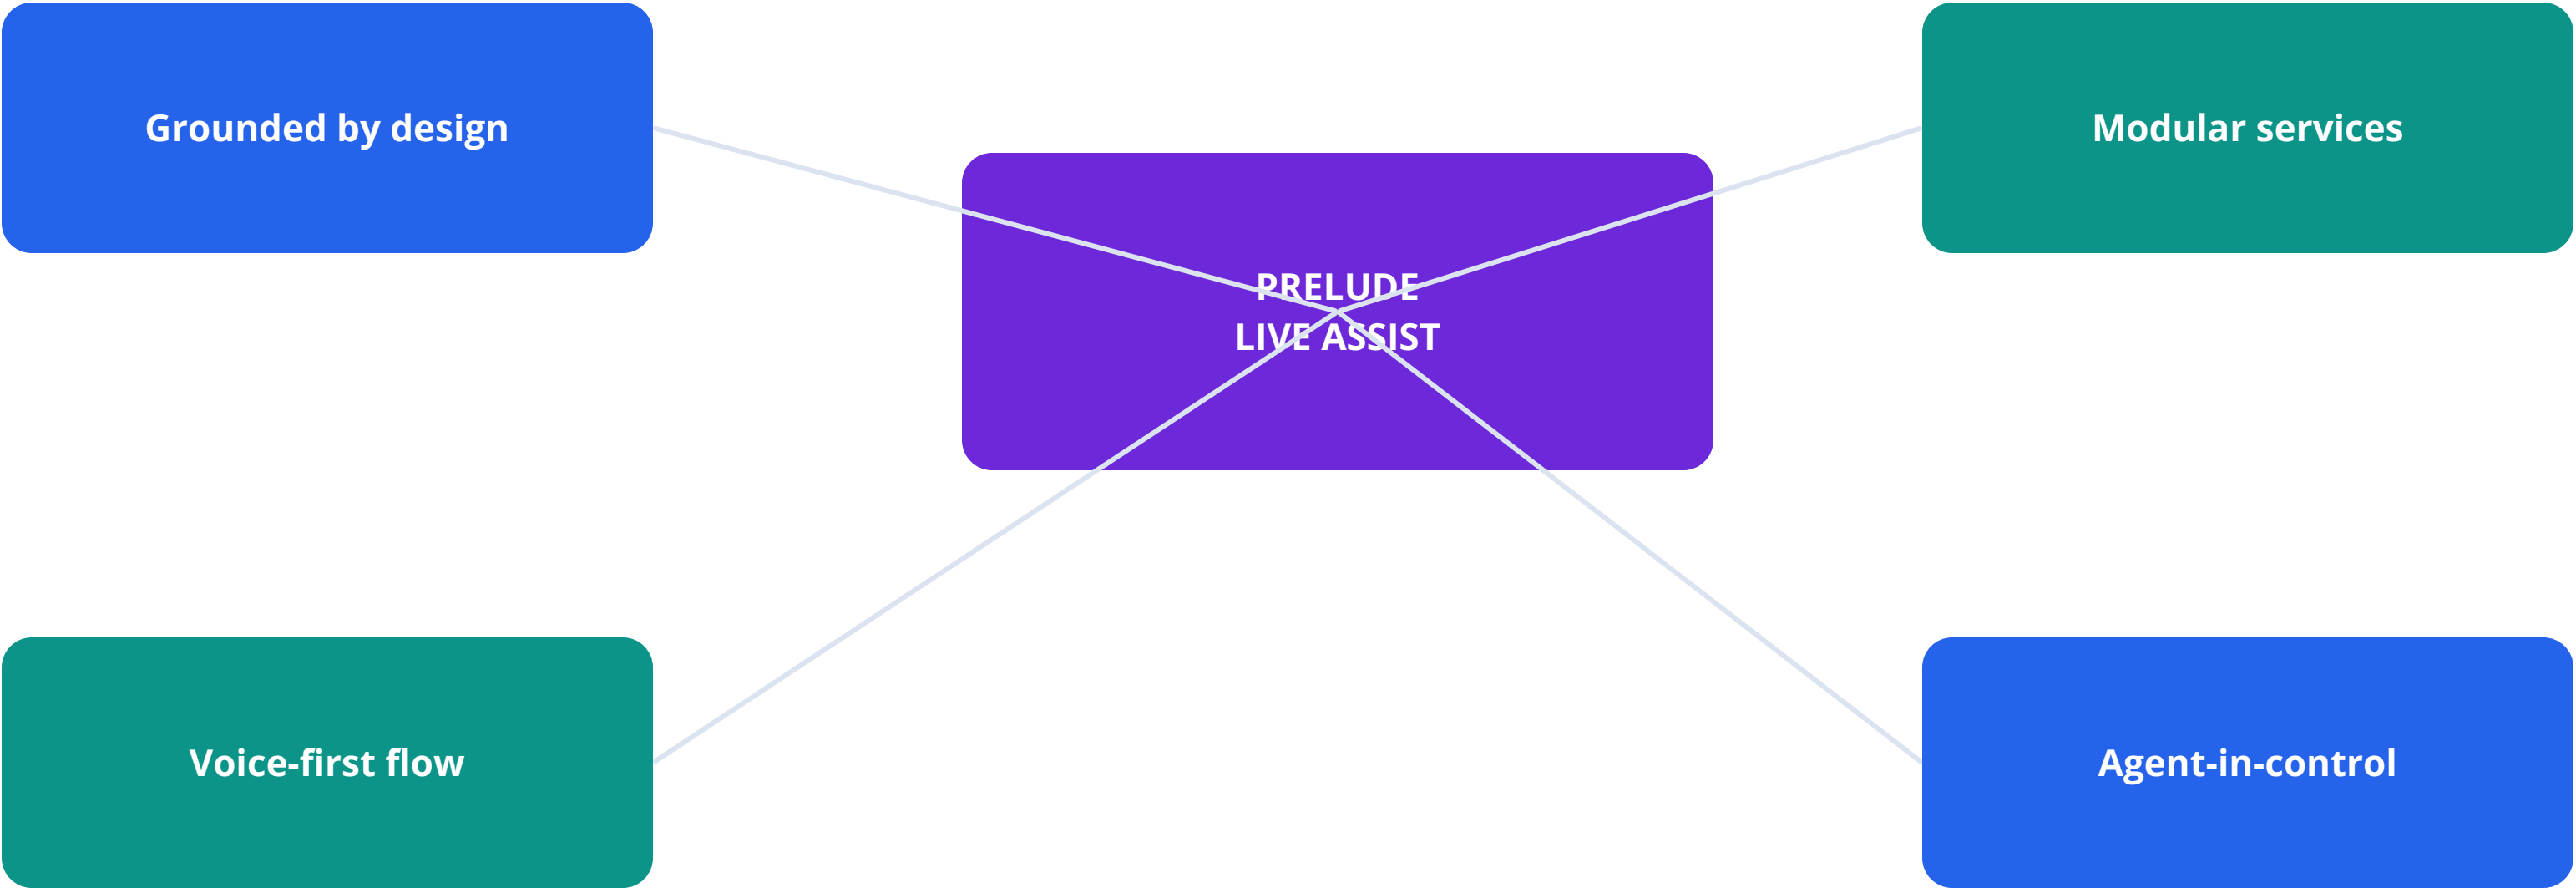

Limitations

Latency, noisy audio and knowledge freshness remain key areas for production validation.

From prototype to dependable copilot

Differentiation is in the system—not the slogan

Composable architecture, trusted context and a workflow that supports—not replaces—the human agent.

Updated on Public GitHub

Working prototype code — public or shared GitHub repo (Y/N)
